

So...You would like a wall space at our Fair? No probs but, a “wall space” in this venue, does not mean you have a “wall”. It just means you have no one behind you. Let me explain, with additional pics for clarity.

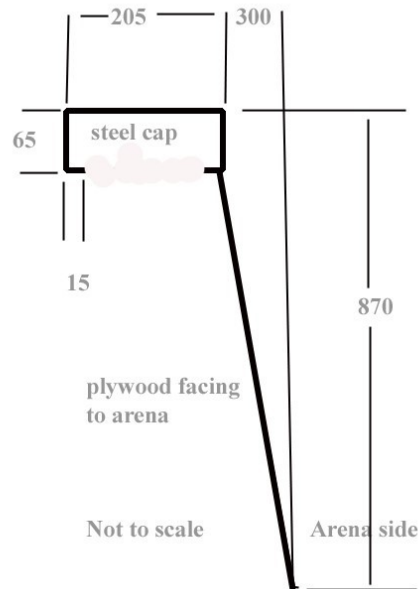

The building is shaped like a half cylinder, on its side. The part we use, is an arena, within this curved roof.

The arena boundary is a low barrier, just under 900mm tall, capped with a “c” shaped steel section, on which you can build a vertical structure, should you want to do so.

The front of the barrier is thick plywood sheeting and, NO, you can’t fasten anything to that. Your tables will be in front of the barrier as per usual, with slightly more space than usual.

Section of arena “wall” typical

It is suggested to use a “G” clamp (or 3) to secure timber to the top of the section as a shelf or, to secure a frame to the section to hold a vertical structure, reaching to the floor.

The “G” clamp would be used upside down to reach inside the “C” section

In either case, you will need something to stop items falling outside the barrier as it will be a long walk to go get the item.

Outside arena showing clamp

As before, but on top

Showing inside arena with start of framework suggestion
